

UNIVERSITY OF MUMBAI

Teacher's Reference Manual

Subject: Artificial Intelligence

with effect from the academic year
2018 – 2019

PRACTICAL NO-1

- A. Write a program to implement depth first search algorithm.
- B. Write a program to implement breadth first search algorithm

AIM:-

Write a program to implement depth first search algorithm.

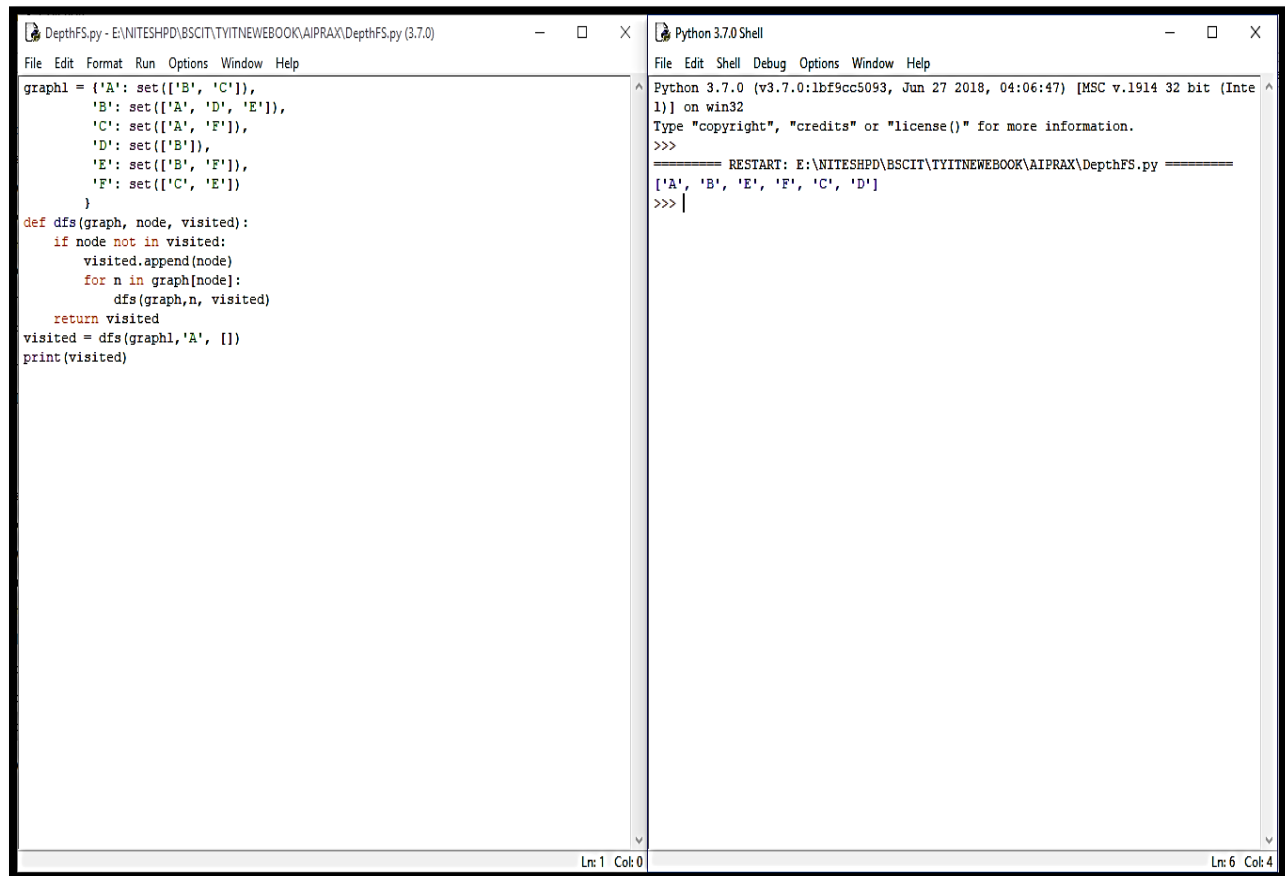

GRAPH:-

PYTHON CODE:-

```
graph1 = {  
    'A': set(['B', 'C']),  
    'B': set(['A', 'D', 'E']),  
    'C': set(['A', 'F']),  
    'D': set(['B']),  
    'E': set(['B', 'F']),  
    'F': set(['C', 'E'])  
}  
  
def dfs(graph, node, visited):  
    if node not in visited:  
        visited.append(node)  
        for n in graph[node]:  
            dfs(graph,n, visited)
```

```
    return visited
visited = dfs(graph1,'A', [])
print(visited)
```

OUTPUT:-

The screenshot displays a Python IDE with two windows. The left window, titled 'DepthFS.py', contains the following code:

```
graph1 = {'A': set(['B', 'C']),
          'B': set(['A', 'D', 'E']),
          'C': set(['A', 'F']),
          'D': set(['B']),
          'E': set(['B', 'F']),
          'F': set(['C', 'E'])
        }
def dfs(graph, node, visited):
    if node not in visited:
        visited.append(node)
        for n in graph[node]:
            dfs(graph, n, visited)
    return visited
visited = dfs(graph1, 'A', [])
print(visited)
```

The right window, titled 'Python 3.7.0 Shell', shows the output of the program:

```
Python 3.7.0 (v3.7.0:1bf9cc5093, Jun 27 2018, 04:06:47) [MSC v.1914 32 bit (Intel)] on win32
Type "copyright", "credits" or "license()" for more information.
>>>
===== RESTART: E:\NITESHDPD\BSCIT\TYITNEWBOOK\AI\PRAX\DepthFS.py =====
['A', 'B', 'E', 'F', 'C', 'D']
>>> |
```

The status bar at the bottom indicates the current line and column for both windows: 'Ln: 1 Col: 0' for the editor and 'Ln: 6 Col: 4' for the shell.

AIM:-

Write a program to implement breadth first search algorithm.

GRAPH:-**PYTHON CODE:-**

sample graph implemented as a dictionary

```
graph = {'A': set(['B', 'C']),
        'B': set(['A', 'D', 'E']),
        'C': set(['A', 'F']),
        'D': set(['B']),
        'E': set(['B', 'F']),
        'F': set(['C', 'E'])
        }
```

#Implement Logic of BFS

```
def bfs(start):
    queue = [start]
    levels={} #This Dict Keeps track of levels
    levels[start]=0 #Depth of start node is 0
    visited = set(start)
    while queue:
        node = queue.pop(0)
        neighbours=graph[node]
        for neighbor in neighbours:
```

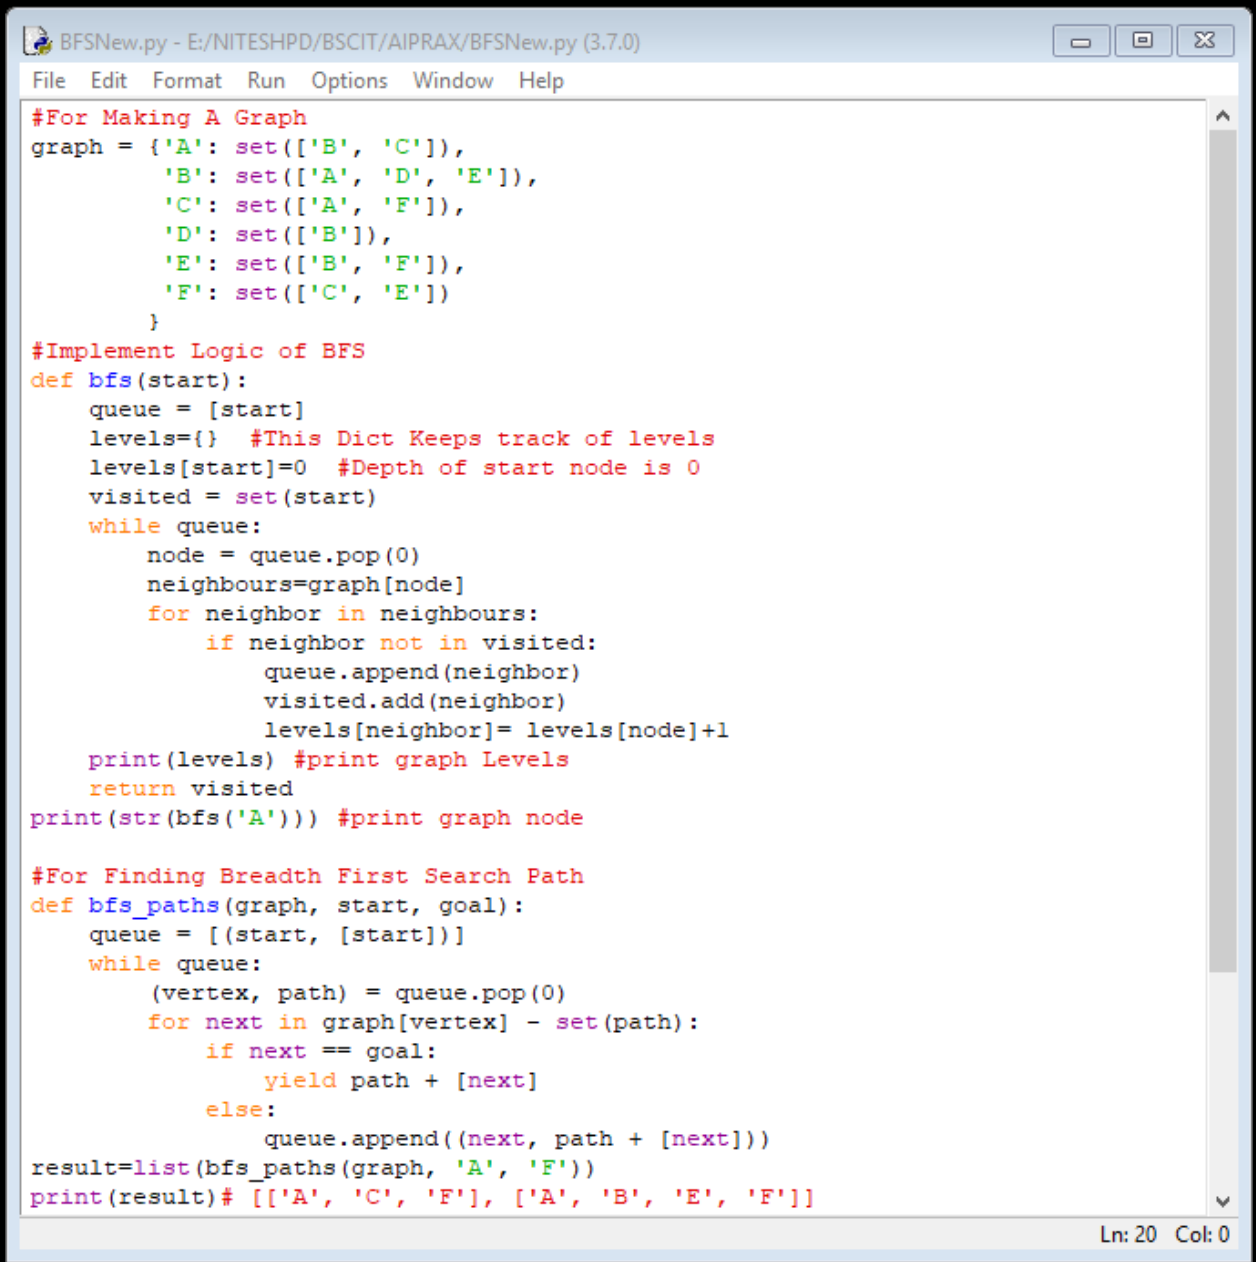

```
        if neighbor not in visited:
            queue.append(neighbor)
            visited.add(neighbor)
            levels[neighbor]= levels[node]+1
    print(levels) #print graph level
    return visited
print(str(bfs('A'))) #print graph node
```

#For Finding Breadth First Search Path

```
def bfs_paths(graph, start, goal):
    queue = [(start, [start])]
    while queue:
        (vertex, path) = queue.pop(0)
        for next in graph[vertex] - set(path):
            if next == goal:
                yield path + [next]
            else:
                queue.append((next, path + [next]))
result=list(bfs_paths(graph, 'A', 'F'))
print(result)# [['A', 'C', 'F'], ['A', 'B', 'E', 'F']]
```

#For finding shortest path

```
def shortest_path(graph, start, goal):
    try:
        return next(bfs_paths(graph, start, goal))
    except StopIteration:
        return None
result1=shortest_path(graph, 'A', 'F')
print(result1)# ['A', 'C', 'F']
```

OUTPUT:-A screenshot of a Python IDE window titled 'BFSNew.py - E:/NITESHDPD/BSCIT/AIPRAX/BFSNew.py (3.7.0)'. The window has a menu bar with 'File', 'Edit', 'Format', 'Run', 'Options', 'Window', and 'Help'. The code is written in Python and implements a Breadth-First Search (BFS) algorithm. It defines a graph with nodes A through F and their neighbors. It then implements a BFS function that returns the levels of each node and a function to find the search path from a start node to a goal node. The output of the code is printed at the bottom of the window.

```
#For Making A Graph
graph = {'A': set(['B', 'C']),
        'B': set(['A', 'D', 'E']),
        'C': set(['A', 'F']),
        'D': set(['B']),
        'E': set(['B', 'F']),
        'F': set(['C', 'E'])
        }

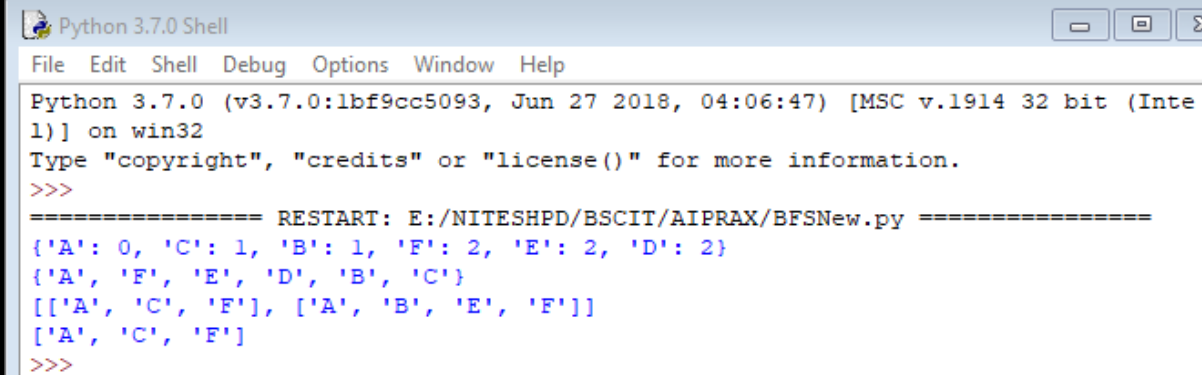

#Implement Logic of BFS
def bfs(start):
    queue = [start]
    levels={} #This Dict Keeps track of levels

Output:-

A screenshot of a Python IDE window titled 'waterjugproblem.py - E:\NITESH\PD\BSCIT\TYITNEW\BOOK\AI\PRAX\waterjugproblem.py (3.7.0)'. The window has a menu bar with 'File', 'Edit', 'Format', 'Run', 'Options', 'Window', and 'Help'. The code is written in a light blue font on a white background. It defines a function 'get_all_states' that takes a state tuple (a, b, c) and returns a list of states. The function checks for visited states and generates new states by pouring water between jugs. The main code sets the initial state to (12, 0, 0) and calls 'get_all_states'. The output is not visible in the screenshot.

    if(player%2!=0):
        print("Player 1 Won")
    else:
        print("Player 2 Won")
```

NOTE:-
Game Rules

1. Traditionally the first player plays with "X". So you can decide who wants to go with "X" and who wants go with "O".
2. Only one player can play at a time.
3. If any of the players have filled a square then the other player and the same player cannot override that square.
4. There are only two conditions that may match will be draw or may win.
5. The player that succeeds in placing three respective marks (X or O) in a horizontal, vertical or diagonal row wins the game.

AIM:-

Design an application to simulate number puzzle problem.

PYHTON CODE:-

```
'''
```

8 puzzle problem, a smaller version of the fifteen puzzle:

States are defined as string representations of the pieces on the puzzle.

Actions denote what piece will be moved to the empty space.

States must allways be immutable. We will use strings, but internally most of the time we will convert those strings to lists, which are easier to handle.

For example, the state (string):

'1-2-3

4-5-6

7-8-e'

will become (in lists):

[['1', '2', '3'],

['4', '5', '6'],

['7', '8', 'e']]

```
'''
```

```
from __future__ import print_function
```

```

PRACTICAL No.-7**A. Write a program to shuffle Deck of cards.****B. Solve traveling salesman problem using artificial intelligence technique.****Aim:-**

Write a program to shuffle Deck of cards.

Diagram:-**Python Code:-**

```
#first let's import random procedures since we will be shuffling
import random
```

```
#next, let's start building list holders so we can place our cards in there:
```

```
cardfaces = []
suits = ["Hearts", "Diamonds", "Clubs", "Spades"]
royals = ["J", "Q", "K", "A"]
deck = []
```

```
#now, let's start using loops to add our content:
```

```
for i in range(2,11):
    cardfaces.append(str(i)) #this adds numbers 2-10 and converts them to string
data
```

```
for j in range(4):
```

```
cardfaces.append(royals[j]) #this will add the royal faces to the cardbase

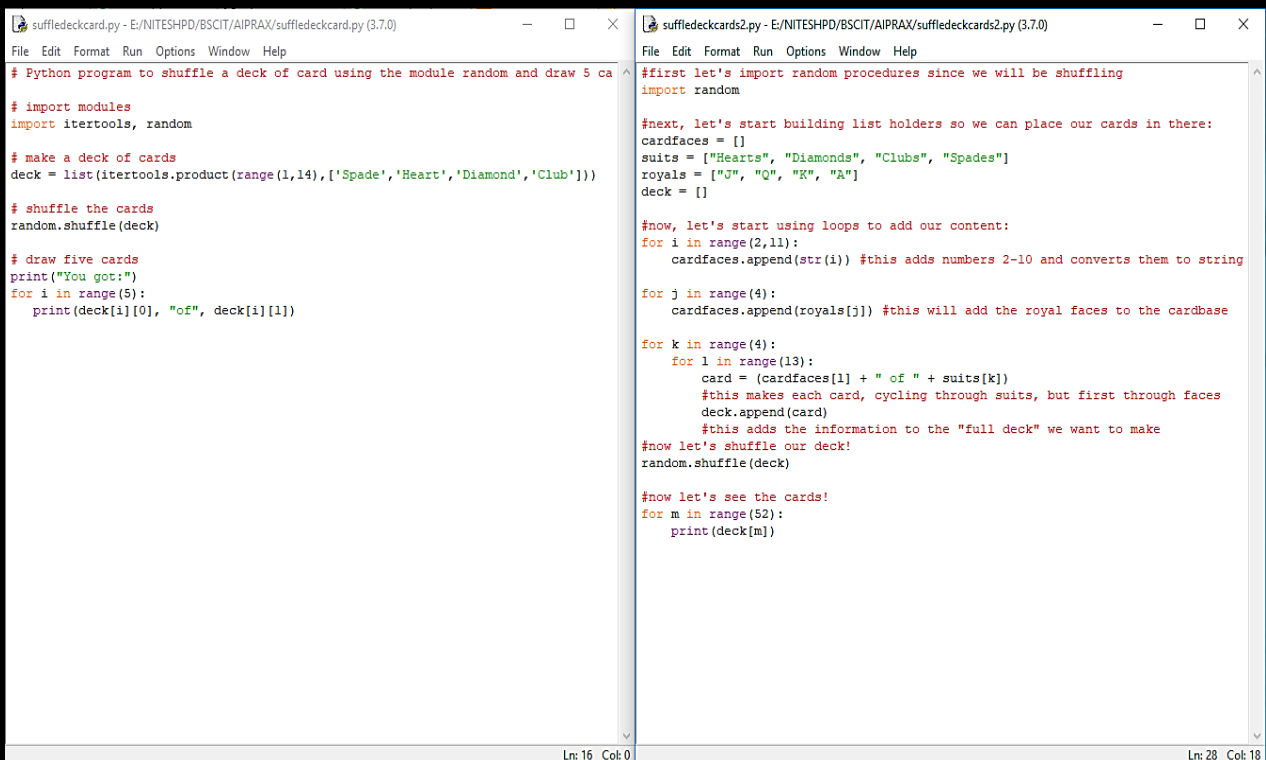

for k in range(4):
    for l in range(13):
        card = (cardfaces[l] + " of " + suits[k])
        #this makes each card, cycling through suits, but first through faces
        deck.append(card)
        #this adds the information to the "full deck" we want to make
#now let's shuffle our deck!
    random.shuffle(deck)

#now let's see the cards!
for m in range(52):
    print(deck[m])
```

OR

```
# Python program to shuffle a deck of card using the module random and draw 5 cards
# import modules
import itertools, random
# make a deck of cards
deck = list(itertools.product(range(1,14),['Spade','Heart','Diamond','Club']))
# shuffle the cards
random.shuffle(deck)
# draw five cards
print("You got:")
for i in range(5):
    print(deck[i][0], "of", deck[i][1])
```

Output:-

```
# Python program to shuffle a deck of card using the module random and draw 5 cards
# import modules
import itertools, random

# make a deck of cards
deck = list(itertools.product(range(1,14),['Spade','Heart','Diamond','Club']))

# shuffle the cards
random.shuffle(deck)

# draw five cards
print("You got:")
